

BROADCAST- Flu Remains Bigger Threat than COVID-19 (Updated)

Editor's note: CDC reports flu-related deaths in the U.S. has reached 16,000 with five pediatric deaths in Illinois and two in Michigan. This story was updated 2/26/2020 to reflect updated number of pediatric deaths nationally, including in Illinois and Michigan.

Despite heightened alerts about COVID-19 and the need to prepare for possible future restricted activities, local health leaders stress the seasonal flu remains far more concerning. The Centers for Disease Control and Prevention says flu activity remains high in the US and expected to continue for weeks. The agency emphasizes pediatric deaths, at 105, are the second highest since they were included in weekly reporting in 2004.

In Illinois and throughout the country, health facilities are mostly treating the unusual Influenza B-Victoria strain of flu virus. Terri McCrery, infection preventionist for OSF HealthCare says the numbers affected by the new coronavirus can't compare to the seasonal flu.

"You're talking a handful nationally here with the coronavirus and you're talking millions with the flu so we need to be watchful of the flu," she warned.

McCrery says this latest flu strain is affecting children most significantly. The overall cumulative hospitalization rate — 47.4 per 100,000 population — is similar to that seen in recent influenza seasons; however, "rates in children and young adults are higher than at this time in recent seasons," the CDC reports.

"You're talking a handful nationally here with the coronavirus and you're talking millions with the flu so we need to be watchful with the flu." (:08)

Even if you don't often get sick, McCrery says it only takes one exposure to influenza which is a long-lasting airborne virus. She says the flu can have a devastating impact, even on those considered young and with a healthy immune system.

"It's not too late to get the flu shot. Don't think you're going to be one of the ones that it skips by and not get the flu because you could get it and it could be deadly." (:10)

A 16 year-old Joey Sandhaas, a junior at Ball-Chatham, Illinois school district [died from complications of the flu](#) earlier this month.

McCrery also encourages those who have flu-like symptoms to be seen early, especially if they have underlying health issues.

SOT- Terri McCrery, infection preventionist for OSF HealthCare

"Don't go out in public if you have the signs and symptoms – the fever, the cough, runny nose. Stay home but then if you're home for a day or two, go be seen. Don't let it wait. The flu can turn into pneumonia, bronchitis and that would be require to be seen by the doctor so please be cautious." (:18)

Anti-viral drugs can be used to treat flu illness. The CDC recommends prompt treatment for people who have flu infection or suspected flu infection and who are at high risk of serious flu complications, such as people with asthma, diabetes (including gestational diabetes), or heart disease.

OSF HealthCare has imposed visitor restrictions for all of its hospitals to prevent the spread of flu.

*For website story

Effective immediately, it is requested that:

- Visitors should be at least 18 years of age and older. This will minimize patient exposure to children, who are known to be high risk for transmission of viral infections, and will also help protect children from contracting an illness while visiting the hospital.

- Individuals who are not feeling well or have had flu-like symptoms in the past seven days should not visit hospitalized patients. Flu-like symptoms include a fever of 100 degrees Fahrenheit or higher, cough, and/or sore throat.
- When entering and leaving a patient's room, everyone should wash their hands with soap and water or use an alcohol-based hand foam/gel. Washing helps limit the spread of disease.
- People should cough or sneeze into their arm, shoulder, or tissue (not hands) to reduce the spread of germs that can be passed from hands touching surfaces or people.

If you suspect you have the flu, please call ahead to your health care provider including [OSF Urgo](#) or [OSF PromptCare](#) so staff can take proper precautions to assess you. [OSF OnCall](#) is also an online option where you can be connected virtually to be assessed.
