

Script – Broadcast – If the weighted vest fits, wear it

INTRO

As spring approaches, more people will head outdoors to take a walk or run. One way to add to the intensity of your workout is by wearing a weighted vest.

Adding weight to a walk or run is nothing new. People have been using hand weights or wrist and ankle weights for years. But experts say wearing a vest across your upper body evenly distributes the added weight.

(((SOT)))

Dr. Faheem Ahmad, sports medicine physician, OSF HealthCare

"I highly recommend it to most of my patients, because if you think about it, it adds to whatever kind of exercise you're doing," says Faheem Ahmad, MD, a sports medicine physician with OSF HealthCare. "If you're doing cardio, it adds resistance or strength training. It adds more of a challenge to it." (:20)

VO

Dr. Ahmad says the benefits include burning more calories, higher heart rate, improved posture, increased strength and gaining a stronger core. Kicking up the intensity of your workout will make your heart work harder. And walking with a weighted vest works your leg muscles.

Anyone can use a weighted vest unless you have experienced certain health conditions including dizziness, high blood pressure, osteoporosis or have recently suffered a heart attack. Added weight doesn't help if you have arthritis in your hips or knees either. The key to using a vest is to use caution and start slowly. Add distance and intensity as you get used to wearing the weighted vest.

Dr. Ahmad recommends coming up with a game plan. Begin by using a vest that is 5% of your body weight. For example, if you weigh 150 pounds, begin with a vest that weighs 7.5 pounds. And test your vest by taking a short walk around your neighborhood.

TAG

Lisa Crocker of Belvidere, Illinois, began using a 10-pound weighted vest last summer, when she read about the trend on TikTok. She started slowly, walking a mile at a time before working up to six miles. She has noticed a significant difference in her workouts.

The main reasons I wanted one was to help improve my core and posture, she says. It's really helped, and I burn more calories. Now I notice a big difference when I don't wear it. Crocker adds that three of her friends have now purchased weighted vests.

Like Crocker, Dr. Ahmad says many of his patients are curious about the idea of wearing a weighted vest. Most of the questions center on benefits and safety issues.

Dr. Ahmad says there is no shortage of weighted vests to choose from. Cost ranges from \$30 to \$300 and up.

But if wearing a vest isn't your thing, don't worry. Dr. Ahmad says what's most important is getting in your daily steps or miles. Always talk with your provider before starting any kind of workout program.
